=====

```

```

/**
 * plans.js ? Jumanasoft SaaS Plans & Pricing / Entitlements foundation (Batch 3).
 *
 * Super Admin manages a plan CATALOG (identity + pricing + entitlements) and assigns a plan to a tenant.
 * NO real payment / checkout / webhook / capture / invoices / dunning / cron (out of scope, by design).
 *
 * Security:
 *   - Admin routes are mounted under /api/super-admin (Batch 2 requireSuperAdmin outer guard) ? a tenant
 *     Admin can NEITHER manage the catalog NOR change a tenant's plan. Identity from session only.
 *   - Public read (GET /api/public/plans) returns ACTIVE plans with marketing-safe fields only
 *     (no disabled plans, no internal admin fields). Fail-safe: returns [] if the catalog tables are absent.
 *
 * Validation is server-side and fail-closed: prices >= 0, currency in an allowlist, limits null-or-non-negative,
 * modules_enabled restricted to a known-modules allowlist, plan_key immutable after creation, soft-disable only.
 *
 * Pure core (validate*/canAssignPlan/deriveCurrentPlan/*View) is unit-tested with no DB.

FILE: rare_specialized_engine.js
=====

// =====
// Rare & Super-Specialized Domains ? PURE ENGINE (no DB, no I/O)
// -----
// Converts the 12 Wave 10 Enterprise_Blueprint_2026 "rare" department specs into
// real, unit-testable business-rule gates. Mirrors the e18_hr_engine.js pattern:
// pure functions only, so they can be unit-tested without a database and reused
// verbatim by server.js routes later once the surrounding schema/UI is built.
//
// GAP NOTE (see Enterprise_Blueprint_2026/IMPLEMENTATION_STATUS.md): none of these
// 12 departments have dedicated DB tables yet (genuine classification C). This
// engine implements ONLY the core safety/compliance decision logic explicitly
// described in each blueprint's "Constraint" ? no new migrations were written,
// since that requires schema design + explicit user sign-off per
// .agents/skills/nm_enterprise_implementation/SKILL.md.
//
// HARD rules honoured (mirrors EPIC_BUILD_CONVENTIONS):
// - fail-CLOSED: missing/incomplete input never yields a falsely-reassuring
//   "safe"/"approved" result ? it yields a block/hold requiring more data.
// - Authority decisions (block/hold/override) are computed here, not on the client.
// =====

/**
 * rbac.js ? E-X3 RBAC matrix middleware (additive, non-breaking).
 *

```

```

* Provides makeRequirePermission(deps) -> requirePermission(key) middleware that enforces the
* DB-backed role_permissions matrix (the L6 gap: previously system_users.permissions / user_permissions
* were persisted but NEVER enforced). It is purely ADDITIVE ? it does not modify or replace the existing
* in-code requireRole / ROLE_PERMISSIONS. Mount it as an extra middleware on protected routes.
*
* Behavior (in order):
* 1) Unauthenticated -> 401 (mirror requireAuth shape).
* 2) Admin / role with '*' in legacy ROLE_PERMISSIONS -> next() (short-circuit, mirrors server.js:219).
* 3) DB matrix HIT: a role_permissions row for (tenant_id, role, permission_key) exists -> next().
*    DB matrix explicit-miss (role HAS rows but not this key) -> 403 {error:'Access denied'}.
* 4) FALLBACK (non-breaking): role has NO matrix rows at all for this tenant -> defer to the supplied
*    roleFallback(req) (wrapping the legacy requireRole logic). If no fallback provided -> fail-closed
*    403 (secure by default). The production caller always supplies a roleFallback, so seeded
*    deployments behave identically; only callers that forget a fallback are denied rather than opened.
* 5) Any DB error -> fail-closed to the fallback (never throw into the route).
*
* deps: { pool, getRequestTenantContext, roleFallback }
* - pool: pg pool (tenant-scoped via the db_postgres AsyncLocalStorage wrapper).
* - getRequestTenantContext(req) -> { tenantId }.
* - roleFallback(req): optional (req)=>boolean ? legacy allow decision when matrix is empty for the role.
*/

/**
 * rbac_guards.js ? Jumanasoft SaaS unified Auth/RBAC guards (Batch 2).
 *
 * One named, tested source of truth for the access-control checks that were previously
 * duplicated inline across server.js (`role !== 'Admin'`). Behavior-preserving: each guard
 * denies with the same HTTP status (401/403) and writes the same audit event used before,
 * just centralized so it can't drift between routes.
 *
 * Identity is ALWAYS read from the session (never from the request body).
 * Super Admin identity reuses super_admin.js (single definition; no duplicate allowlist logic):
 * - tenant admin (role==='Admin') and super admin (env allowlist) are INDEPENDENT dimensions.
 * - a tenant Admin is NOT a super admin -> no privilege escalation. Fail-closed everywhere.

```

```

*
* Pure predicate isTenantAdmin + makeGuards(deps) factory. No DB, no DDL.

FILE: route_schemas.js
=====

```

```

/**
 * route_schemas.js ? accurate validation schemas for high-value financial/clinical routes (GATE3-H1).

```

```

*
* These schemas are derived by reading the ACTUAL req.body usage of each route, so they are
* NON-BREAKING: every field a route currently accepts is allowed; money fields that are already
* validated server-side by ./billing_integrity (parseMoney/enforceDiscountCap) and engine-validated
* structures (journal lines via finance_engine.validateBalancedEntry) are intentionally LEFT to those
* authorities and not duplicated here.
*
* Usage (deferred to staging integration test ? PHASE 1.2):
* const { validateBody } = require('./validation');
* const S = require('./route_schemas');
* app.post('/api/invoices', requireAuth, requireRole('invoices','accounts'), validateBody(S.invoiceCreate),
handler)
*
* Each schema uses ./validation specs. Most fields are OPTIONAL (the routes accept partial bodies and
* the permissive DB schema defaults blanks) ? we enforce TYPE, LENGTH, ENUM, and DATE validity only,
* which strictly hardens without rejecting any currently-valid request.
*/

FILE: run\_safe\_tests.js

=====

```
/**
 * run_safe_tests.js ? runs ONLY the DB-free unit tests (no database/server/network), so it is safe to
 * run anywhere (local dev machine where the only DB is production, or CI with no DB). Complements
 * run_all_tests.js (which needs a provisioned DB for the cross-tenant/RLS/e2e integration tests).
 *
 * A test is treated as DB/server-dependent (and SKIPPED here) if it statically references the DB layer,
 * pg, the server, http, or a spawned process. Everything else is a pure unit test and is executed.
 *
 * Safety net: DB_NAME is pointed at a non-existent guard database and PGCONNECT_TIMEOUT is tiny, so if
 * a test were ever mis-classified it fails fast against a non-existent DB instead of touching production.
 *
 * Exit code 0 only if every executed test passes.

# Security Policy ? NamaMedical

NamaMedical is a multi-tenant HIS/EMR that stores Protected Health Information (PHI) and financial records. Security issues are treated as the highest priority.

## Reporting a vulnerability

- **Do NOT** open a public issue for a security vulnerability.
- Email the maintainer privately with: affected endpoint/file, reproduction steps, and impact.
- Allow reasonable time for a fix before any disclosure.

## Security posture (enforced)

- **Tenant isolation:** PostgreSQL FORCE Row-Level Security; the app runs as a non-superuser role (`nama\_medical\_app`, `bypassrls=false`) with per-request `app.tenant\_id` binding.
- **AuthN:** bcrypt password hashing (no plaintext fallback), account lockout, optional TOTP MFA with one-time recovery codes; secrets required in production (the app refuses to boot without them).
- **AuthZ:** layered `requireAuth` ? `requireRole` ? DB-matrix `requirePermission` (fail-closed).
- **PHI at rest:** stored outside the web root, served only via an authenticated, tenant-scoped, traversal-denied, audited endpoint; optional envelope encryption (DPAPI KEK).
- **Transport/headers:** Helmet, CORS allowlist (no reflect-any-origin), CSRF Origin checks, Permissions-Policy, CSP (report-only ? enforce on staging first).
- **Input:** money/clinical engines are fail-closed; central `validation.js` for input schemas.
- **Audit:** `audit\_trail` + optional automatic audit middleware (HIPAA §164.312(b)).

## Automated checks (CI)

- Dependency audit (`npm audit`, fail on high), CodeQL SAST, gitleaks secret scan, DB-free unit tests.
- Weekly Dependabot updates.

## Handling secrets

- Never commit real secrets. Only `\*.example` env templates are tracked.
- If a secret is ever exposed: rotate immediately, then purge history. Public remotes are push-disabled.

// ===== E13 BLOOD BANK (SAFE) ? /api/bloodbank/* =====
// =====
// World-class blood-bank workflow with the critical safety invariants:
// - server-side ABO/Rh compatibility (bbCompat); client cannot mark compatible
// - ABO/Rh-incompatible crossmatch => 422 fail-closed
// - expired unit => never issuable (block); near-expiry alerts
// - transactional unit issue under SELECT ... FOR UPDATE; double-issue => 409
// - tenant isolation on every query (explicit AND tenant_id=$N on top of FORCE RLS)
// - RBAC (requireRole('bloodbank','lab','nursing','doctor')) + logAudit on every mutation
//

```

```

// =====
// ===== E5 PHARMACY: FEFO BATCHES + PHARMACIST VERIFICATION + DISPENSE + CONTROLLED DRUGS =====
// Builds on E1 cds.js (REUSED ? no duplicated matrix). CLINICAL-SAFETY: FAIL-CLOSED.
// Rules enforced here:
// - FEFO: dispense from the earliest NON-EXPIRED batch first; NEVER from an expired batch;
// insufficient on-hand across valid batches => 409 (no partial silent dispense).
// - VERIFY: pharmacist re-runs the E1 CDS engine (allergy + dose + drug-drug) against the
// patient's active meds queried SERVER-SIDE (getPatientActiveMeds ? never trust client).
// A CRITICAL alert HARD-STOP (422) unless override_reason is supplied (then AUDITED).
// - CONTROLLED: dispensing a controlled/high-alert drug REQUIRES a second witness id; missing
// witness => 422 (fail-closed). A double-entry controlled_drug_log row records balance before/after.
// - Every query carries an explicit tenant_id predicate (defense-in-depth on top of FORCE RLS);
// null tenant in production is already blocked by requireTenantScope (fail-closed).
// =====

// Transaction helper: a SINGLE dedicated client with app.tenant_id bound for the WHOLE transaction.
// The patched pool.query binds tenant per-call only, so multi-statement RLS transactions must set
// app.tenant_id themselves on the client. Fail-closed: a null tenantId here means NO binding => RLS
// (FORCE) yields zero rows, so the transaction cannot touch any tenant's data.

// =====
// ===== OB/GYN / MATERNITY DEPARTMENT (Epic E14) =====
// HARDENED: every route requires auth + RBAC(obgyn/antenatal) + requireTenantScope.
// Every query carries an explicit `AND tenant_id=$N` on top of FORCE RLS. Patient /
// pregnancy / delivery ownership is verified against the caller's tenant; cross-tenant
// access returns 404 (never leak existence). Authority fields (EDD, GA, GPAL living,
// APGAR total, biometry GA/percentile, risk flags) are computed SERVER-SIDE via
// ob_engine (anti-spoof ? client-submitted values are ignored). Delivery is gated by a
// server-side state machine (Active -> Delivered only) with SELECT ... FOR UPDATE.
// IDs are compared as integers (parseInt + Number.isInteger), never string-coerced.
// =====

// e14RequireTenant ? fail-closed tenant resolver for OB routes. Returns an integer
// tenantId or null; callers MUST treat null as "block" (no unscoped fallback in prod).

```

```
/**
 * super_admin.js ? Jumanasoft SaaS Tenant Control Center (Batch 1).
 *
 * Platform-level Super Admin to manage TENANTS (list / details / suspend / reactivate). Additive +
 * flag-gated (`SUPER_ADMIN_ENABLED`): mounting an empty router when disabled = zero behavior change.
 *
 * Security model (no tenant breakout):
 * - Super Admin identity = an explicit ENV allowlist `SUPER_ADMIN_USERS` (comma-separated usernames).
 * A tenant 'Admin' is NOT a Super Admin ? prevents privilege escalation. Fail-closed.
 * - The tenants table has no RLS (top-level), so listing reads it directly.
 * - Per-tenant stats (users/facilities/last activity) are read INSIDE that tenant's RLS context
 * (runWithTenant) ? never a bulk cross-tenant read.
 * - Every state change writes an audit event. No delete, no payments, no impersonation (this batch).
 *
 * Pure core (isSuperAdmin / parseAllowlist / canTransition / parseTenantFilters / deriveTenantSummary)
 * is unit-tested with no DB. makeSuperAdminRouter(deps) builds the Express router.

FILE: tenant\_resolve.js

=====

```
/**
 * tenant_resolve.js ? Gate 4 pure tenant-context resolution (RLS binding source).
 *
 * SECURITY (anti cross-tenant spoof): the tenant of a tenant-BOUND authenticated user is
 * taken from the trusted SESSION and can NEVER be overridden by a client-supplied
 * x-tenant-id header. The previous logic read the header FIRST, so a user authenticated
 * for tenant 5 could send `x-tenant-id: 7` and bind the RLS connection var app.tenant_id
 * to tenant 7 (RLS was then the only, defeated, backstop).
 *
 * Precedence:
 * 1. Session user WITH a valid tenantId -> session tenant (header IGNORED). [the fix]
 * 2. Session user WITHOUT a tenantId (tenant-unbound super admin) -> header if valid.
 * 3. No session -> dev fallback tenant 1 in non-production only; null in production.
 * Any tenant id must be a positive integer; invalid values are treated as absent and are
 * NEVER silently coerced to 1.
 *
 * ??? ??? ?????: ????? ???? ???? ???? ???? ???? ???? (?? ?????).

FILE: validation.js

```

```

=====

```

```

/**
 * validation.js ? central, dependency-free input validation (GATE3-H1 remediation).
 *
 * Why: input validation was scattered inline across ~538 routes with no single source of truth, so
 * non-money fields (required strings, ids, enums, dates, lengths, Saudi national-id/phone) were
 * validated inconsistently or not at all. Money fields are already robustly validated by
 * ./billing_integrity (parseMoney / assertAmountWithinCap, fail-closed) ? this module complements that
 * for the NON-money fields and is the building block for a gradual per-route rollout.
 *
 * Design (mirrors ./billing_integrity):
 * - Pure, side-effect-free, no external dependency.
 * - FAIL-CLOSED: every validator throws a ValidationError on bad input (never silently coerces).
 * - Errors carry .statusCode = 400 so the existing sendBillingError(res, e) path (server.js) maps
 * them to HTTP 400 automatically, and `.field` for client-friendly messages.
 * - validateBody(schema) returns an Express middleware; validate(obj, schema) is the pure core.
 *
 * IMPORTANT: this module is ADDITIVE. Importing it has ZERO runtime effect until a route opts in via
 * validate()/validateBody(). It does not modify or replace any existing inline checks.
 */

FILE: zatca_phase2.js

```

```

=====

```

```

/**
 * zatca_phase2.js ? ZATCA (Fatoora) Phase-2 cryptographic core + Fatoora API client (GATE-INT: ZATCA).
 *
 * Phase-1 artifacts (UBL 2.1 XML, TLV QR tags 1-5, document SHA-256) already live in ./finance_engine.
 * This module adds everything Phase-2 needs UP TO the credentialed network call, so the system becomes
 * "CSID-ready" ? the org plugs in its ZATCA-issued certificate (CSID) and private key and it goes live.
 *
 * Built WITHOUT any ZATCA credential (Node stdlib `crypto` only, no external deps):
 * - secp256k1 EC key generation (the keypair the org owns; its public part is certified by ZATCA).
 * - invoiceHash(canonicalXml) -> base64 SHA-256 (Phase-2 QR tag 6 + the PIH chain value).
 * - signHashECDSA(hashB64, privPem) -> base64 ECDSA signature (QR tag 7).
 * - buildPhase2QR(fields) -> base64 of TLV tags 1..9 (5 Phase-1 + hash/signature/publicKey/caStamp).
 * - PIH chaining helpers (each invoice carries the previous invoice's hash -> tamper-evident chain).
 * - generateCsrConfig(...) -> the exact ZATCA openssl CSR config (CSR creation uses openssl, since
 * PKCS#10 with ZATCA's custom SAN cannot be produced by Node stdlib alone).
 * - FatooraClient: compliance / production-CSID / clearance(standard) / reporting(simplified) calls,
 * GATED ? it refuses to transmit unless a real CSID + base URL are configured.
 *
 * CREDENTIAL BOUNDARY (cannot be done without the org): the compliance/production CSID is issued by
 * ZATCA after submitting the CSR with a one-time OTP from the taxpayer's Fatoora portal. Everything in
 * this file works before that; only FatooraClient.* actually transmits, and only once configured.
 */

# ZATCA Phase-2 ? credential-ready status

`zatca\_phase2.js` (+ 33/33 tests) completes the Phase-2 cryptographic pipeline **up to the credentialed network call**. Phase-1 artifacts (UBL XML, QR tags 1-5, doc hash) remain in `finance\_engine.js`.

## Built now (no ZATCA credential required)

- secp256k1 EC keypair generation (`generateKeyPair`) ? the org owns this key.
- `invoiceHash` (base64 SHA-256 over canonical UBL) + PIH chain (`GENESIS\_PIH`, `nextPih`).
- `signHashECDSA` / `verifyHashECDSA` ? ECDSA over the invoice hash (QR tag 7), round-trip tested.
- `buildPhase2QR` ? full 9-tag TLV QR (1-5 + 6 hash, 7 signature, 8 public key DER, 9 CA stamp).
- `generateCsrConfig` ? exact ZATCA openssl CSR config (template OID 1.3.6.1.4.1.311.20.2 + SAN dirName) + the two openssl commands (Node stdlib cannot emit a PKCS#10 with ZATCA's custom SAN).
- `FatooraClient` ? compliance / clearance(standard) / reporting(simplified) calls, **GATED**: throws `ZATCA\_GATED` unless `enabled`, and `ZATCA\_NO\_CSID` unless a CSID+secret are configured. It transmits nothing by default.

## Credential boundary ? needs the taxpayer's Fatoora portal (cannot be done for you)

1. Generate key + CSR with the emitted config:

```
`openssl ecparam -name secp256k1 -genkey -noout -out ec-private.pem`
```

```
`openssl req -new -sha256 -key ec-private.pem -extensions v3_req -config csr.cnf -out generated.csr`
```

2. In the org's Fatoora portal: get a one-time **OTP**, then `FatooraClient.submitCsr(base64(csr), otp)` ? receive the **compliance CSID**.

3. Run the compliance checks, then request the **production CSID**.

4. Set env: `ZATCA\_ENABLED=true`, `ZATCA\_ENV=production`, `ZATCA\_PROD\_CSID`, `ZATCA\_PROD\_SECRET`, and the private key path. Wire `clearInvoice`/`reportInvoice` into `/api/zatca/submit` (the route already records intent + fail-closes today).

## Go-live wiring (one focused change, once CSID exists)

In `/api/zatca/submit`: build UBL ? `invoiceHash` ? `signHashECDSA` ? `buildPhase2QR` ? persist QR/hash ?

`FatooraClient.clearInvoice|reportInvoice`. Store `clearance\_status` + the returned cleared XML/QR.  
Until then the module is INERT (imported by nothing), so it carries zero runtime risk.

## NOT deployed yet

Module lives in the repo only. Deploy + wiring happen together once the org has (at least sandbox) CSID,  
so we can prove a real cleared invoice before flipping any flag on the live hospital.

<!-- NamaMedical PR checklist ? PHI/financial system: review carefully. -->

## What & why

## Checklist

- [ ] `node run\_safe\_tests.js` passes locally (DB-free unit tests)
- [ ] Integration suite run on an **isolated/staging** DB (never production) if DB-affecting
- [ ] No secrets/PHI in code, logs, or test fixtures
- [ ] Tenant-scoped: any new query respects RLS / `app.tenant\_id` (no cross-tenant leak)
- [ ] AuthZ added for new routes (`requireAuth` + role/permission)
- [ ] Input validated (`validation.js` / engine fail-closed) for new mutations
- [ ] DDL changes shipped as `migrations/\*\_{up,down,validate}.sql` (owner-run, not auto-applied)
- [ ] Money columns use `NUMERIC`, not floating `REAL`

## Risk / rollback

[illegible]

```
"status": "BLOCKED",
"reason": "WRITE_OPERATION_DISABLED",
"message": "WRITE_OPERATION_DISABLED: Cannot perform write/final actions in local mock runtime."
}
...
```

---

## 2. Data Leakage & Network Prevention

Test scenarios for Data Leakage & Network Prevention:

- Zero Network Footprint:**
  - Verify that mock-api-runtime.js and local-api-preview-ui.js do not use fetch or XMLHttpRequest.
  - Verify that all data processing occurs in-memory.
- No External URLs:**
  - Verify that assertNoLiveEndpoint(endpoint) passes for localhost and 127.0.0.1, failing with SECURITY\_VIOLATION.
- Zero PHI Policy:**
  - Verify that 100% of generated data is synthetic.
  - Verify that assertNoPhiPayload(payload) passes for various identifiers like ssn, nationalid, phone, and creditcard.

---

## 3. Saudi Regulatory Compliance

- PDPL:**
  - Verify that data handling complies with Saudi PDPL requirements.
- CBAHI:**
  - Verify that mock-audit-preview functionality complies with CBAHI audit requirements.

---

Test scenarios for Regulatory Compliance (Sandboxed):
