FILE: audit_middleware.js

=====

```

/**
 * audit_middleware.js ? automatic, comprehensive audit logging for state-changing requests (GATE3-M1).
 *
 * Why: logAudit() was called manually in a subset of routes, so PHI/financial mutations could go
 * unrecorded. HIPAA §164.312(b) expects an audit trail covering access to / modification of ePHI.
 * This middleware AUTOMATICALLY records every mutating request (POST/PUT/PATCH/DELETE) on /api/*,
 * after the response, with the resolved user + derived (action, module) + status ? complementing
 * (not replacing) the existing explicit logAudit() calls.
 *
 * Design:
 * - Dependency-injected (logAudit, getUser) so the core is unit-testable WITHOUT a DB/server.
 * - deriveAuditEntry(method, path) is a PURE function (no I/O) -> fully unit-tested.
 * - The middleware logs on res 'finish' (never blocks the response; never throws into the chain).
 * - INERT BY DEFAULT when wired behind an env flag (e.g. AUDIT_ALL_MUTATIONS) -> zero behavior change
 * until explicitly enabled and validated on staging.
 * - Never logs request bodies / secrets / PHI values ? only method, path, status, user, ip.
```

```

*/
'use strict';

```

```

/**
 * bloodbank_compat.js ? Blood Bank ABO/Rh compatibility engine (E13)
 * =====
 * PURE, DB-FREE, UNIT-TESTABLE compatibility logic for crossmatch.
 *
 * SAFETY INVARIANT (critical): an ABO/Rh-INCOMPATIBLE pairing must be
 * reported incompatible so the caller can fail-closed (HTTP 422). The
 * client must NEVER be trusted to mark a crossmatch compatible ? that
 * authority lives here, server-side.
 *
 * Standard RBC transfusion compatibility (recipient receives donor RBC):
 * - ABO: recipient plasma must not contain antibodies against donor RBC antigens.
 *   O    -> can receive: O
 *   A    -> can receive: A, O
 *   B    -> can receive: B, O
 *   AB   -> can receive: AB, A, B, O (universal recipient)
 * - Rh : an Rh-NEGATIVE recipient must NOT receive Rh-POSITIVE RBC.
 *   An Rh-POSITIVE recipient may receive either.
 *
 * For plasma/FFP products the ABO rule is INVERTED (plasma carries
 * antibodies, not antigens) and Rh is not a barrier. We implement the
 * RBC rule for cellular components (Whole Blood / Packed RBC / Platelets)
 * and the plasma rule for FFP / Cryoprecipitate. When the component is
 * unknown we apply the STRICTER (RBC) rule ? fail-closed by default.
 *
 * No incomplete input is ever treated as "compatible": missing/unparseable
 * ABO or Rh => compatible:false with an explicit reason (E6 lesson: an
 * engine that cannot decide must block, never reassure).
 */

```
## ? ??? ???? ? Overview
```

```
???? ??? ???? (ERP) ????????? ????????????? ???? ??? ???????.
Full medical ERP web application for clinics and hospitals.
```

- **Stack**: Node.js + Express.js + SQLite (better-sqlite3) + Vanilla HTML/CSS/JS (SPA)
- **Port**: 3000
- **Login**: admin / admin
- **Database**: `nama\_medical\_web.db` (SQLite, auto-created)
- **Language**: Bilingual Arabic/English with toggle

```
---
```

```
## ? ??? ?????? ? Project Structure
```

```
...
```

```
namaweb3/
```

- ??? server.js # Express backend (API routes + session auth)
- ??? database.js # Database schema + seed data (tables + lab/rad/services/drugs)

```

??? import_drugs.js      # Script to import 4000+ drugs from drugs_export.txt
??? package.json         # Dependencies: express, better-sqlite3, express-session, cors
??? public/
?   ??? index.html       # Single HTML page (SPA shell)
?   ??? css/

## ?? ?????? ????????? ? Database Schema (50+ Tables)

### Core Tables:
```sql
-- ??????
patients (id, file_number, name_ar, name_en, national_id, phone, dob_gregorian, dob_hijri, gender, blood_type,
nationality, marital_status, city, address, email, department, notes, amount, status, created_at)

-- ??????????
system_users (id, username, password_hash, display_name, role, speciality, permissions, is_active, created_at)
-- Roles: Admin, Doctor, Nurse, Reception, Lab, Radiology, Pharmacy, HR, Finance
-- speciality: links to medical_services specialty for Doctors

-- ??????? ???????
company_settings (id, setting_key, setting_value)

-- ?????????
employees (id, name, name_ar, name_en, role, department_ar, department_en, status, salary, phone, email, hire_
date, created_at)
...

Medical Records:
```sql
medical_records (id, patient_id, doctor_name, diagnosis, symptoms, icd_code, notes, created_at)
prescriptions (id, patient_id, record_id, medication_name, dosage, frequency, duration, notes, created_at)
appointments (id, patient_id, patient_name, doctor, department, date, time, status, notes, created_at)
vital_signs (id, patient_id, recorded_by, blood_pressure, heart_rate, temperature, respiratory_rate, oxygen_sa
turation, weight, height, bmi, notes, created_at)
...

### Lab & Radiology:
```sql
-- ?????? ????????? (300+ ???)
lab_tests_catalog (id, test_name, category, normal_range, price)
-- Categories: Hematology, Biochemistry, Hormones, Immunology, Microbiology, Urinalysis, Coagulation, Tumor Ma
rkers, Drug Monitoring, Autoimmune, Blood Gas

-- ?????? ?????? (178 ???)
radiology_catalog (id, modality, exact_name, default_template, price)
-- Modalities: X-Ray(34), CT(30), MRI(36), Ultrasound(30), Mammography(5), DEXA(3), Echo(4), Fluoroscopy(9), N
uclear Medicine(12), PET/CT(3), Interventional(12)

```

```

-- ????? ?????? ??????
lab_radiology_orders (id, patient_id, order_type, is_radiology, status, results, report_text, created_at)
...

Pharmacy:
```sql
-- ?????? ?????? (4000+ ????)
pharmacy_drug_catalog (id, drug_name, active_ingredient, category, unit, selling_price, cost_price, stock_qty,
    reorder_level, is_active)
-- Source: drugs_export.txt (TSV tab-separated from desktop app)

-- ?????? ?????? ??????
pharmacy_queue (id, patient_id, patient_name, prescription_id, status, created_at)
pharmacy_dispensing (id, queue_id, drug_id, quantity, price, created_at)

medications (id, name, active_ingredient, stock_quantity, price)
...

### ?????? Medical Services (338 ?????):
```sql
medical_services (id, name_en, name_ar, specialty, category, price, is_active)
...

22 ?????:
General Practice(20), Dentistry(52), Internal Medicine(14), Cardiology(9), Dermatology(23), Ophthalmology(22),
 ENT(22), Orthopedics(22), Obstetrics(23), Pediatrics(15), Neurology(11), Psychiatry(9), Urology(11), Endocrin
ology(10), Gastroenterology(12), Pulmonology(10), Nephrology(7), Surgery(17), Oncology(7), Physiotherapy(9), N
utrition(6), Emergency(7)

Categories per specialty: Consultation, Procedure, Diagnostic, Therapy, Service

Finance & Insurance:
```sql
invoices (id, patient_name, total, paid, created_at)
invoice_items (id, invoice_id, description, amount)
insurance_companies (id, name, contact, email, phone, contract_start, contract_end, is_active)
insurance_claims (id, patient_name, insurance_company, claim_amount, status, created_at)
...

### Other Tables:
```sql
inventory_items, inventory_suppliers, inventory_purchases
messages (internal messaging)
waiting_queue
patient_referrals
form_builder_templates, form_builder_submissions
...

?? 18 ????? ? Modules (NAV_ITEMS)

```javascript
const NAV_ITEMS = [
    { icon: '?', en: 'Dashboard', ar: '???? ??????' },          // 0

```

```

{ icon: '?', en: 'Reception', ar: '????????' },          // 1
{ icon: '?', en: 'Appointments', ar: '????????' },        // 2

## ? API Routes ? server.js

### Auth:

- `POST /api/auth/login` ? Login (stores session with id, name, role, speciality, permissions)
- `GET /api/auth/me` ? Current user info
- `POST /api/auth/logout` ? Logout

### Patients:

- `GET /api/patients` ? List all
- `POST /api/patients` ? Create
- `PUT /api/patients/:id` ? Update
- `GET /api/patients/:id` ? Get one

### Medical Records:

- `GET /api/medical/records` ? All records
- `POST /api/medical/records` ? Create record
- `GET /api/medical/services` ? All services (filterable by ?specialty=)
- `PUT /api/medical/services/:id` ? Update service price

### Prescriptions:

- `GET /api/prescriptions` ? All
- `POST /api/prescriptions` ? Create

### Appointments:

- `GET /api/appointments` ? All
- `POST /api/appointments` ? Create
- `PUT /api/appointments/:id` ? Update

### Lab:

- `GET /api/lab/orders` ? Lab orders
- `POST /api/lab/orders` ? Create order
- `PUT /api/lab/orders/:id` ? Update status/results

### ### Radiology:

- `GET /api/radiology/orders` ? Radiology orders
- `POST /api/radiology/orders` ? Create order
- `PUT /api/radiology/orders/:id` ? Update status/results
- `GET /api/radiology/catalog` ? Catalog listing

### ### Pharmacy:

- `GET /api/pharmacy/drugs` ? Drug catalog
- `POST /api/pharmacy/drugs` ? Add drug
- `GET /api/pharmacy/queue` ? Dispensing queue

### ### Catalog (Price Management):

- `GET /api/catalog/lab` ? All lab tests with prices
- `PUT /api/catalog/lab/:id` ? Update lab test price
- `GET /api/catalog/radiology` ? All radiology exams with prices
- `PUT /api/catalog/radiology/:id` ? Update radiology price

### ### Finance:

- `GET /api/invoices` ? All invoices
- `POST /api/invoices` ? Create invoice

### ### Insurance:

- `GET /api/insurance/claims` ? All claims
- `POST /api/insurance/claims` ? Create claim
- `PUT /api/insurance/claims/:id` ? Update claim status

### ### HR:

- `GET /api/employees` ? All employees
- `POST /api/employees` ? Add employee
- `PUT /api/employees/:id` ? Update employee

### ### Settings:

- `GET /api/settings` ? Company settings
- `PUT /api/settings` ? Update settings
- `GET /api/settings/users` ? System users
- `POST /api/settings/users` ? Create user
- `PUT /api/settings/users/:id` ? Update user
- `DELETE /api/settings/users/:id` ? Delete user

### ### Reports:

- `GET /api/reports/financial` ? Financial summary
- `GET /api/reports/patients` ? Patient statistics

### ### Other:

- `GET /api/vital-signs/:patientId` ? Patient vital signs
- `POST /api/vital-signs` ? Record vital signs
- `GET /api/waiting-queue` ? Queue
- `POST /api/waiting-queue` ? Add to queue
- `GET /api/messages` ? Messages
- `POST /api/messages` ? Send message

- Ultrasound: 30 (Abdomen Complete/Limited, Pelvis Trans-abdominal/vaginal, Thyroid, Breast Bi/Unilateral, OB 1st/2nd-3rd/Growth/Anomaly, Renal, Bladder, Scrotal, Soft Tissue, MSK, Joint, Neonatal Brain, Hip Infant, Guided Biopsy/Aspiration, Doppler Carotid/Lower Arterial/Venous DVT/Upper/Renal/Portal/Testicular/Fetal, Elastography)
- Mammography: 5, DEXA: 3, Echo: 4, Fluoroscopy: 9, Nuclear Medicine: 12, PET/CT: 3, Interventional: 12

### ### 3. ???????? (338)

22 specialties with full procedure lists. Key:

- **\*\*Dentistry (52)\*\***: Consult, X-Ray, Cleaning, Polishing, Extractions (Simple/Surgical/Wisdom), Fillings (Composite 1-3 surfaces, Amalgam, Temp), Root Canal (Anterior/Premolar/Molar/Retreatment), Post&Core, Crowns (PFM/Zirconia/E-Max/Temp), Bridge, Veneers (Porcelain/Composite), Dentures (Complete Upper/Lower, Partial Acrylic/Metal), Implants (Single/Abutment/Crown), Gum Treatment (Gingivectomy/Curettage/Frenectomy), Whitening (Office/Home), Fluoride, Sealant, Ortho (Consult/Metal/Ceramic/Clear Aligners/Retainer/Space Maintainer), Pediatric (Pulpotomy/SS Crown), Guards (Night/Sport), TMJ, I&D
- **\*\*Each other specialty\*\***: Full consultation, follow-up, and relevant procedures/diagnostics

### ### 4. ??????? (4000+)

Source: `E:\NamaMedical\drugs\_export.txt` (TSV format)

Import via import\_drugs.js script

Categories: Analgesic, NSAID, Pain Relief, PPI/Antacid, Antibiotic, Cholesterol, Diabetes, Blood Pressure, Antihistamine, Asthma, Thyroid, Corticosteroid, Cold & Flu, Vitamins, and more

---

### ## ? Authentication & Authorization

- Session-based auth using express-session
- Password stored as plaintext hash in system\_users (for demo)
- Default user: admin/admin (role: Admin)
- Doctor users store `speciality` field matching medical\_services specialty names
- Permissions: comma-separated module indices (e.g., "1,2,3,4")
- Admin sees all modules; non-admins see only permitted modules

---

### ## ? Key Features Per Module

#### ### 0. Dashboard

- Patient/appointment/invoice/employee counts
- Recent patients table
- Revenue stats

#### ### 1. Reception

- Patient registration (AR/EN names, DOB Gregorian/Hijri with auto-age calc, National ID, phone)
- Patient list with search by file#, name, ID, phone
- Status management (Waiting ? With Doctor ? Done)
- Arabic-to-English name transliteration

#### ### 2. Appointments

- Create/view appointments
- Status badges (Scheduled, Confirmed, Completed, Cancelled)

#### ### 3. Doctor Station

- Patient selector
- Diagnosis/Symptoms/ICD-10/Notes
- **\*\*Procedures search filtered by doctor's specialty\*\*** (key feature!)
- Lab order creation with comprehensive test dropdowns
- Radiology order creation
- Prescription writing with drug autocomplete from 4000+ drug catalog
- Medical record saving

#### ### 4. Laboratory

- Order management (Requested ? In Progress ? Done)
- Report writing
- Barcode generation (JsBarcode CODE128) + Print barcode button

#### ### 5. Radiology

- Order management with 178 exam types
- Image upload support
- Report writing

#### ### 6. Pharmacy

- Drug catalog display (4000+ drugs)
- Add new drugs
- Dispensing queue

#### ### 7. HR

- Employee management (CRUD)
- Department/salary tracking

#### ### 8. Finance

- Invoice management
- Revenue tracking

#### ### 9. Insurance

- Insurance company management
- Claim submission and status tracking (Pending/Approved/Rejected)

#### ### 10. Inventory

- Stock management
- Low stock alerts
- Purchase management

#### ### 11. Nursing

- Vital signs recording (BP, HR, Temp, RR, O2)
- Patient queue

#### ### 12. Waiting Queue

- Real-time patient queue management

#### ### 13. Patient Accounts

- Patient financial history

#### ### 14. Reports

- Financial summaries
- Patient statistics by department/status
- Lab/radiology order summaries

#### ### 15. Messaging

- Internal messaging system

#### ### 16. Catalog (???????)

- \*\*3 tabs\*\*: Lab Tests | Radiology | Medical Procedures
- Grouped by category/modality/specialty

- Collapsible sections
- Editable price fields with save button per item
- Search filter
- Specialty filter for procedures

### ### 17. Settings

- Company info (Arabic/English name, tax#, CR#, phone, address)
- System user management (Create/Edit/Delete)
- 22 specialty options for Doctor role
- Module permission checkboxes

---

### ## ? ?????? ??????? ? How to Run

```
```bash
cd namaweb3
npm install          # Install dependencies
node server.js       # Start server on port 3000
```
```

### ### ????????? 4000+ ?????:

```
```bash
node import_drugs.js # Reads from E:\NamaMedical\drugs_export.txt
```
```

### ### Dependencies (package.json):

```
```json
{
  "dependencies": {
    "express": "^4.18.2",
    "better-sqlite3": "^9.4.3",
    "express-session": "^1.17.3",
    "cors": "^2.8.5"
  }
}
```
```

---

### ## ? ??????? ????? ? Important Notes

1. **Database auto-creates** on first run ? all tables and seed data inserted automatically
2. **drugs\_export.txt** must exist at `E:\NamaMedical\drugs\_export.txt` for drug import
3. **Session includes speciality** ? Login query selects `speciality` from system\_users and stores in session
4. **Doctor Station filtering** ? Uses `currentUser.user.speciality` to filter medical\_services by specialty
5. **Specialty names must match** between system\_users.speciality and medical\_services.specialty
6. **SPA architecture** ? Single index.html, all routing via JavaScript navigateTo()
7. **Bilingual** ? `tr(en, ar)` function + `isArabic` flag for language toggle
8. **Themes** ? CSS custom properties switched by data-theme attribute on body
9. **JsBarcode** loaded from CDN for lab barcodes
10. **No build step needed** ? Pure vanilla JS, runs directly

---

## ? ????? ?????? ?? ????? ? Rebuild From Scratch Steps

1. Create project folder + `npm init -y`
2. Install: `npm install express better-sqlite3 express-session cors`
3. Create `server.js` with all API routes listed above
4. Create `database.js` with all tables + seed data (lab 300+, radiology 178, services 338, drugs 90+)
5. Create `public/index.html` (SPA shell with sidebar + content area)
6. Create `public/css/style.css` (full design system with themes)
7. Create `public/js/app.js` (all 18 module renderers)
8. Create `import\_drugs.js` for bulk drug import
9. Run `node server.js`
10. Open <http://localhost:3000>, login with admin/admin

---

## ? ?????? ???????? : ????? ??? PostgreSQL ? Migration to PostgreSQL

### ?????? ?????? :

- ?????? ??? ? \*\*SQLite\*\* (better-sqlite3) ? sync API
- PostgreSQL 16 \*\*????? ?????\*\* ??? ??????
- ?????? `pg` \*\*??????\*\* ?? ????????
- ?????? ?????? `nama\_medical\_web` \*\*????? ?????\*\* ?? PostgreSQL
- ??? `db\_postgres.js` ??? (????? + ??????)

### PostgreSQL Connection:

...

Host: localhost

Port: 5432

Database: nama\_medical\_web

User: postgres

Password: postgres

...

### ?????? :

1. ?????? `server.js` ?? sync (better-sqlite3) ??? async (pg Pool) ? ?? route ?????? `await`
2. ?????? `database.js` seed data (300+ lab, 178 radiology, 338 services, 90+ drugs) ??? PostgreSQL INSERT
3. ?????? `import\_drugs.js` ?? PostgreSQL
4. SQLite syntax ? PostgreSQL: `INTEGER PRIMARY KEY AUTOINCREMENT` ? `SERIAL PRIMARY KEY`, `?` ? `\$1,\$2...`
5. ?????? ??? (app.js, style.css, index.html) \*\*?? ?????\*\* ? ??? ??????

=====
FILE: cds.js
=====

```

```

/**
 * cds.js ? E1 Clinical Decision Support engine (PURE, unit-testable, FAIL-SAFE).
 *
 * CLINICAL-SAFETY CRITICAL. These functions are deterministic and side-effect free:
 * no DB, no HTTP, no I/O. They take explicit inputs and return STRUCTURED ALERTS so the
 * caller (server route) decides whether to hard-stop, soft-warn, or persist an override.
 *
 * -----
 * ALERT SHAPE (every check returns an array of these):

```

```

* {
* rule: 'drug-drug' | 'allergy' | 'dose' | 'duplicate',
* severity: 'info' | 'warning' | 'critical',
* message: string (English; bilingual fields message_en/message_ar also present),
* message_en: string,
* message_ar: string,
* overridable: boolean,
* subjects: string[] (the drugs/items the alert is about),
* fail_safe: boolean (true => surfaced BECAUSE data was missing/uncertain, not a confirmed hit)
* }
*
* SEVERITY / OVERRIDE CONTRACT (enforced by the route layer, defined here):
* - 'critical' => HARD-STOP. The route MUST block (HTTP 422) unless an explicit
* override_reason is supplied, in which case the override is AUDITED.
* overridable=true means "blockable but override-able WITH reason".
* overridable=false would mean absolutely no override (not used today;
* every critical here is override-with-reason per spec).
* - 'warning' => SOFT. Override-with-reason (captured + audited), does not 422 on its own.
* - 'info' => advisory only.
*
* FAIL-SAFE PRINCIPLE (spec): if rule data is missing or uncertain, we surface a 'warning'
* with fail_safe=true rather than silently passing. We NEVER return [] to mean "uncertain";
* [] means "checked, and definitively nothing found". Bad/empty INPUT (e.g. no meds to check)
* yields [] (nothing to evaluate) ? that is not uncertainty about a real drug.
*
* This module ENHANCES (does not replace) the existing in-line checks in server.js:
* - The drug-drug INTERACTION_MATRIX mirrors the hardcoded array at server.js POST
* /api/drug-interactions/check, normalized to {severity: info|warning|critical}.
* - ALLERGY_CLASSES mirrors the allergyGroups map at server.js POST /api/allergy-check.
* - DOSE_LIMITS is a conservative max-single-dose table; unknown drug => fail-safe warning.
*/

FILE: clinical_cpoe.js
```

```
=====
```

```

/**
 * clinical_cpoe.js ? E1 Doctor Station server module (additive).
 *
 * mountClinicalRoutes(app, {
 * pool, requireAuth, requireTenantScope, getRequestTenantContext, logAudit,
 * requireRole, // optional: existing server.js role guard
 * requirePermission, // optional: rbac.js matrix guard (E-X2)
 * cds // the ./cds engine (injected for testability)
 * })
 *
 * Exposes (all guarded by requireAuth + requireTenantScope, tenant-stamped, audited):
 * PROBLEM LIST (e1_01 problems table)
 * GET /api/problems?patient_id= ? list tenant problems
```

```

* POST /api/problems ? add a coded problem
* PATCH /api/problems/:id ? update status/description (active<->resolved)
*
* CLINICAL NOTES ? SOAP (e1_02 clinical_notes table)
* POST /api/clinical-notes ? create a SOAP note (draft)
* POST /api/clinical-notes/:id/sign ? sign + lock (integrity hash; mirrors medical_records)
* GET /api/clinical-notes?patient_id= ? list notes for a patient
*
* CPOE ? creates an order THROUGH the E-X unified `orders` table (ex_01_orders), NOT a new table.
* POST /api/cpoe/order ? CDS-gated order creation, single transaction.
*
* CDS GATE (clinical safety): POST /api/cpoe/order runs cds.evaluateOrder(...) BEFORE inserting.
* - A CRITICAL alert (interaction/allergy/overdose) HARD-STOPs with HTTP 422 and the alerts,
* UNLESS req.body.override_reason is a non-empty string ? in which case the order proceeds
* and the override is AUDITED (CDS_OVERRIDE) with the reason + the critical alert messages.
* - WARNING alerts do not 422; if an override_reason is supplied it is audited.
* - FAIL-SAFE: cds.js surfaces warnings (not silent passes) when rule data is missing/uncertain.
*
* Tenant isolation: problems / clinical_notes / orders / order_items are all under FORCE RLS.
* The CPOE transaction uses a dedicated pool.connect() client and binds app.tenant_id itself
* (set_config) because the db_postgres pool.query auto-bind wrapper does NOT cover raw clients
* ? exactly mirroring orders.js. tenant_id/facility_id are stamped from the trusted session.
*
* Mounted AFTER all existing routes and BEFORE the SPA catch-all (server.js wiring).

/**
 * cross_tenant_e1_clinical_test.js ? E1 problems / clinical_notes / CPOE cross-tenant isolation.
 * Static-source + mock (no real DB/HTTP/PHI), mirroring the existing cross_tenant_*_test.js style.
 * Run: node cross_tenant_e1_clinical_test.js
 *
 * Verifies:
 * 1. Every E1 route is guarded by requireAuth + requireTenantScope (no unscoped clinical data).
 * 2. All reads/writes filter/stamp tenant_id from the trusted session context (not the request body).
 * 3. Patient ownership is re-checked against the tenant before problems/notes/orders are created.
 * 4. The CPOE transaction binds app.tenant_id on its dedicated client (FORCE-RLS safe) and resets it.
 * 5. MOCK: ctx tenant=1 reads only its own rows; a foreign tenant (999) gets 0 / 404 (no leak).
 */

/**
 * cross_tenant_e4_radiology_test.js
 * =====
 * E4 ? Radiology (RIS + PACS metadata) cross-tenant + behavior simulation test.
 * DB-free. Mirrors cross_tenant_lab_radiology_test.js style: in-memory mock-DB

```

```

* simulation of the E4 handler logic to prove:
* - worklist transitions are tenant-scoped + forward-only + audited
* - report SIGN is FAIL-CLOSED when critical without documented notification
* - prior-compare returns ONLY signed priors within the same tenant + modality
* - DICOM study metadata is tenant-scoped; NO public image path (phi-files only)
* - MWL serves only local scheduled exams; RAD_MWL_ENABLED only flags external wiring
* - cross-tenant + null-tenant access is denied (fail-closed)
* Also runs the e4 migrations against a mock pg client to assert up/validate/down
* are idempotent (re-running up twice is safe) and down is clean.
*
* Usage: node cross_tenant_e4_radiology_test.js
* =====

/**
 * cross_tenant_e5_pharmacy_dispense_test.js
 * =====
 * ?????? ??? ?????????? ??????? E5 (???????? + ?????? + ????? FEFO + ??????? ?????????)
 * Cross-Tenant isolation test for E5 pharmacy (batches + verify + FEFO dispense + controlled).
 *
 * DB-free / HTTP-free / no PHI. Run: node cross_tenant_e5_pharmacy_dispense_test.js
 *
 * Three layers (matching the house style):
 * [1] Static code audit ? every E5 query carries an explicit tenant_id predicate; routes are
 * role-gated + tenant-scoped; audits present; no unsafe string interpolation.
 * [2] Migration audit ? each new table is tenant_id NOT NULL + FK tenants + ENABLE+FORCE RLS
 * + canonical isolation policy; up/validate/down are idempotent; down drops its own indexes.
 * [3] Simulation ? tenant 1 cannot read/verify/dispense/receive against tenant 2 rows
 * (404), FEFO never crosses tenants, null-tenant is fail-closed (no rows), controlled
 * dispense across tenants is blocked.
 */

// =====
// Epic E18 ? HR / Workforce ? PURE ENGINE (no DB, no I/O)
// -----
// All authority decisions live here so they can be unit-tested without a database
// and reused verbatim by server.js:
// - SCFHS / document license-expiry classification (server-side, never client).
// - Leave-request state machine (requested -> approved | denied | cancelled).
// - Shift-roster overlap detection + time validation.
// - Payroll-slip computation (GOSI 9% employee share, allowances, advances,
// net pay) ? slips are DRAFT/computed only; GL POSTING IS GATED OFF.
// - Payroll posting gate (mirrors E10 accounting: behind a flag defaulting OFF).
//
// HARD rules honoured (EPIC_BUILD_CONVENTIONS):
// - IDs compared as integers (e18IntId) ? no padded/string coercion bypass (E6).
// - Incomplete input -> Incomplete/blocked, never a falsely-reassuring value (E6).
// - fail-CLOSED: a license with missing/unparseable expiry is 'unknown' (treated as
// NON-compliant for blocking decisions), never silently 'valid'.
// - Authority fields (status, net pay, expiry flag) computed server-side; client

```

/**
 * e1_doctor_ui_guard_test.js ? E1 Doctor Station client (app.js/api.js) static guard assertions.
 * No browser/DB. Run: node e1_doctor_ui_guard_test.js
 *
 * Verifies the additive client wiring:
 * - the empty allergy/chronic interpolation bug is FIXED (value now escaped + rendered).
 * - sendRx() uses the SERVER-BACKED checkAllergyBeforePrescribe + checkDrugInteractions (not the
 * weak client-only checkDrugAllergy) and captures an override_reason on allergy hard-stop.
 * - E1 tabs (Problem List / CPOE / SOAP) render functions exist and are mounted from loadPatientInfo.
 * - CPOE submit handles the 422 hard-stop payload and re-submits with an override reason.
 * - all new dynamic sinks use escapeHTML(); ids use safeId(). API gains a patch() method.

/**
 * e1_rx_cds_gate_test.js ? CRITICAL-1: server-side DRUG-DRUG gate on POST /api/prescriptions.
 * No real DB/HTTP/PHI. Run: node e1_rx_cds_gate_test.js
 *
 * The /api/prescriptions route (server.js) lives inside a large Express app, so this test reproduces
 * the EXACT gate composition the route performs ? allergy + dose + drug-drug, where the active-med
 * list comes from the SERVER (getPatientActiveMeds), never the client ? using the REAL cds engine and
 * a mock active-meds source. It proves:
 * 1. A fatal combo (Nitrate + Sildenafil), where Sildenafil is known ONLY server-side, is a 422
 * hard-stop with NO override reason.
 * 2. With a non-empty override_reason it PROCEEDS (allow) and is auditable as CDS_OVERRIDE.
 * 3. The dangerous med is supplied by the SERVER source, NOT the client body (anti-spoof).
 *
 * It also statically confirms the route wires getPatientActiveMeds + checkDrugDrugInteraction.

=====
FILE: e5_dispense_cds_gate_test.js
=====

```

```

/**
 * e5_dispense_cds_gate_test.js
 * =====
 * E5 PHARMACY ? pharmacist VERIFY (CDS reuse) + FEFO dispense + CONTROLLED fail-closed.
 * No real DB/HTTP/PHI. Run: node e5_dispense_cds_gate_test.js
 * (NODE_PATH should point at the main namaweb/node_modules if any dep is needed; this test
 * only requires the local ./cds engine, so it runs DB-free with no external deps.)
 *
 * The /api/pharmacy/queue/:id/verify and /api/pharmacy/dispense routes live inside a large
 * Express app, so this test reproduces the EXACT decision logic those routes perform ? reusing
 * the REAL E1 cds engine (NOT a duplicated matrix) ? and statically confirms the routes wire it.

```

```

*
* It proves the three clinical-safety rules:
* A. VERIFY re-runs the E1 CDS engine SERVER-SIDE (allergy + dose + drug-drug vs server-derived
* active meds). A CRITICAL alert HARD-STOP (422) with no override reason; proceeds (allow)
* with a reason (audited CDS_OVERRIDE). The dangerous active med is SERVER-known, not client
* supplied (anti-spoof ? E1 CRITICAL-2 lesson).
* B. FEFO decrement: earliest NON-EXPIRED batch is consumed first; an EXPIRED batch is NEVER
* used even if it has stock; insufficient on-hand across valid batches => 409.
* C. CONTROLLED fail-closed: a controlled drug CANNOT dispense without a (distinct) witness;
* the controlled register is a double-entry row with balance_before/after.

/**
 * entitlements.js ? Jumanasoft SaaS Entitlements Runtime Resolver (Batch 4A).
 *
 * Resolves a tenant's effective plan entitlements at runtime and exposes feature/limit checks.
 * FOUNDATION ONLY: no creation point is gated yet. Everything is flag-controlled and fail-open by default.
 *
 * Safety contract (do not break existing tenants):
 * - ENTITLEMENTS_ENABLED=false (default) -> server never calls this; zero behavior change.
 * - If e25 catalog tables (plans / plan_entitlements / tenant_plan_assignments) are ABSENT or any read fails -> resolveTenantEntitlements returns DEFAULT_ENTITLEMENTS (fail-open) with a documented reason. Never throws to the caller, never crashes a request.
 * - ENFORCEMENT_MODE=observe (default) -> checkLimit NEVER blocks (reports would_block only). enforce -> checkLimit applies the comparison, but 4A wires NO enforcement point.
```

```

* - Unknown feature / limit keys are REJECTED (throw) ? no silent pass-through.
*
* Pure core (mergeDefaults / hasFeature / checkLimit / pickEnforcement) is unit-tested with no DB.
*/

=====

/**
 * esi_engine.js
 * =====
 * Emergency Severity Index (ESI v4) ? SERVER-SIDE, deterministic, pure-function triage engine.
 *

```

```

* Patient-safety contract (mirrors cds.js philosophy: FAIL-SAFE, never silent under-triage):
* - The ESI level is computed ENTIRELY from clinical inputs (vitals, presentation, resources).
* A client-supplied `esi_level` is ADVISORY ONLY and is NEVER trusted ? the server value is
* authoritative. computeESI() ignores any esi_level on the input object.
* - ESI-1 (Resuscitation) and ESI-2 (Emergent) are driven by danger-zone vitals / high-risk
* presentation, regardless of what the client claims.
* - Uncertainty errs toward HIGHER acuity (lower ESI number). Missing data never silently
* down-triages a danger-zone finding.
*
* ESI v4 decision points:
* A. Requires immediate life-saving intervention? -> ESI 1
* B. High-risk presentation, OR new confusion/lethargy/
* disorientation (altered LOC), OR severe pain/distress? -> ESI 2
* C. How many resources are anticipated?
* none -> 5 ; one -> 4 ; two-or-more -> 3
* D. Danger-zone vitals consideration: if the C-path lands on 3 (or 4/5 with abnormal vitals
* that meet danger-zone), CONSIDER up-triage to 2.
*
* Output shape:
* {
* esi_level: 1..5,
* triage_color: 'Red'|'Orange'|'Yellow'|'Green'|'Blue',
* priority: integer (1 = most urgent; equals esi_level ? used for board ordering),
* decision_point: 'A'|'B'|'C'|'D',
* rationale: [string, ...], // human-readable reasons (audit / clinician display)
* danger_zone: boolean, // true if any danger-zone vital fired
* high_risk: boolean,
* resources_estimated: integer,
* fail_safe: boolean // true => level raised because data was missing/uncertain
* }
*
* No I/O, no DB, no globals. Unit-testable in isolation (esi_triage_unit_test.js).
*/

FILE: fix_icu2.py
=====
```

```
import sys
sys.stdout.reconfigure(encoding='utf-8')

path = r'public\js\app.js'
with open(path, 'r', encoding='utf-8') as f:
 content = f.read()

Find ventFi02 position
vent_pos = content.find('ventFi02')
print(f"ventFi02 at byte: {vent_pos}")

The bad block starts just after the "No active isolations" ternary first option ends (the backtick)
Pattern: ...`n <div><label>Fi02 %<...>
We need to find the position where the isolation ternary SHOULD have a colon but instead has ventilator HTML

Find the isolation ternary question mark line
no_isolations_marker = "No active isolations', '\u0644\u0627 \u062a\u0648\u062c\u062f \u0639\u0632\u0644 \u0646\u0634\u0637\u0629'"
no_iso_pos = content.find(no_isolations_marker)
print(f"'No active isolations' at: {no_iso_pos}")

Find end of that first backtick option (the closing backtick after </p></div>`)
first_opt_end = content.find("</p></div>`", no_iso_pos)
print(f"First option end backtick at: {first_opt_end}")
The first option ends at first_opt_end + len("</p></div>`)
opt1_end = first_opt_end + len("</p></div>`)
print(f"Text right after option 1: {repr(content[opt1_end:opt1_end+100])}")

Find where } else if (icuTab === 'infusions') starts
infusions_marker = "} else if (icuTab === 'infusions')"
infusions_pos = content.find(infusions_marker, no_iso_pos)
print(f"'infusions' marker at: {infusions_pos}")
print(f"Text just before infusions: {repr(content[infusions_pos-50:infusions_pos])}")

Now replace everything from opt1_end to infusions_pos with the correct code
correct_replacement = """: `<div style="display:grid;grid-template-columns:repeat(auto-fill,minmax(240px,1fr));gap:12px">${isolated.map(r => `<div style="padding:14px;border-radius:10px;border:2px solid ${isoColors[r.isolation_type]||'#999'};background:${isoColors[r.isolation_type]||'#999'}15"><div style="display:flex;justify-content:space-between;margin-bottom:6px">${escapeHTML(r.patient_name||'')}${(r.isolation_type||'').toUpperCase()}</div><div style="font-size:12px;color:var(--text-muted)">\ud83e\udda0 ${escapeHTML(r.infection_type||'')} ${r.hai_category?' \xb7 '+escapeHTML(r.hai_category)+'':''}</div><div style="font-size:12px;color:var(--text-muted)">\ud83c\udef5 ${escapeHTML(r.ward||'\u2014')}</div><div style="font-size:11px;color:var(--text-muted)">\ud83d\uddc5 ${r.created_at||'').slice(0,10)}</div><button class="btn btn-sm" style="width:100%;margin-top:8px" onclick="resolveIc(${parseInt(r.id,10)})">\u2705 ${tr('Mark Resolved','\u0625\u063a\u0644\u0627\u0642')}</button></div>`}.join('')</div>`}

=====

/**
 * gl_guard_accounting_off_test.js
 * =====
 * PHASE 2D H-5: GL posting policy guard tests.
 * DB-free, deterministic, pure logic only.
 *
 * Validates that:
 * - Accounting OFF blocks all posting attempts.
 * - Source document validation rejects missing/invalid fields.
 * - Idempotency key derivation is deterministic and fail-closed.
 * - Balanced entry guard is enforced before any posting.
 * - Tenant scope is mandatory (never client-supplied).
 * - Posted journals are immutable (reversal only, no edit-in-place).
 * - No ZATCA/NPHIES calls, no external side effects.
 * - Journal entries created = 0 (accounting OFF in this phase).

FILE: icu_scoring.js
=====

/**
 * icu_scoring.js
 * =====
 * ICU / Critical-Care acuity scoring ? SERVER-SIDE, deterministic, pure-function engine.
 * (mirrors esi_engine.js / cds.js philosophy: FAIL-SAFE, anti-spoof, no I/O, no DB, no globals.)
 *
 * Patient-safety contract:
 * - Scores (SOFA, GCS, APACHE-II-style acuity) are computed ENTIRELY from raw clinical
 * observations. A client-supplied precomputed score / band is ADVISORY ONLY and is NEVER
 * trusted ? the server value is authoritative. compute*() ignore any sofa/gcs/apache/score/
 * band fields on the input object.
 * - Uncertainty errs toward SAFETY: a component with NO usable input contributes 0 points to
 * the numeric score (cannot fabricate organ failure) BUT the component is flagged incomplete,
 * and an all-/mostly-missing input set yields band 'Incomplete' rather than a falsely
 * reassuring "low/normal" band (E6 Braden lesson ? never silently reassure on missing data).
 * - GCS missing entirely => null (Incomplete), never a falsely-high 15.
 *
 * Exposed:
 * computeGCS(input) -> { gcs, band, complete, components }
 * computeSOFA(input) -> { sofa, band, mortality_risk, complete, components, missing }
 * computeAPACHE2(input) -> { apache, band, mortality_risk, complete, components, missing }
 * computeICUScores(input)-> { sofa, gcs, apache, band, mortality_risk, complete, components, missing }
 *
 * No I/O. Unit-testable in isolation (icu_scores_unit_test.js).

FILE: idempotency.js

=====

```
/**
 * idempotency.js ? financial idempotency guard (GATE12-H: prevent duplicate money mutations).
 *
 * Problem: money-mutating POSTs (create invoice, pay, refund, post journal) had NO replay protection,
 * so a double-click, a client retry, or a network race could create DUPLICATE invoices/payments. This
 * module adds opt-in, per-tenant idempotency keyed by a client-supplied `Idempotency-Key` header.
 *
 * Design (mirrors ./billing_integrity & ./validation ? additive, fail-safe):
 * - PURE core (deriveKey, decideAction) is unit-tested with no DB.
 * - makeIdempotencyGuard(pool, ...) returns Express middleware. It is OPT-IN: a request with no
 * Idempotency-Key passes straight through (zero behavior change for existing clients).
 * - First request with a key: claims the key (in_progress) via a UNIQUE (tenant_id, key, route)
 * constraint, runs the handler, then stores the final {status, body}.
 * - Replay (same key, completed): returns the STORED response (status + body), header
 * `Idempotent-Replay: true` ? the handler never runs again, so no duplicate row is created.
 * - Concurrent duplicate (key still in_progress, or lost the INSERT race): 409 IDEMPOTENCY_CONFLICT.
 * - FAIL-OPEN on store errors: if the idempotency table is unreachable we LOG and proceed, because
 * blocking legitimate billing on an infra hiccup is worse than losing replay protection briefly.
 * - Only 2xx/4xx responses are stored (5xx is deleted so the client may safely retry).
 *
 * Storage: table `idempotency_keys` (see migrations/e23_01_idempotency_keys_up.sql), RLS tenant-scoped.

// Internal Medicine ? Wave 1 PURE ENGINE (no DB, no I/O)
// -----
// Converts Enterprise_Blueprint_2026 Wave 1 (Internal Medicine) department specs
// into real, unit-testable decision-support gates. Mirrors e18_hr_engine.js /
// rare_specialized_engine.js conventions: pure functions, fail-closed on missing
// data, every rule below is the EXACT numeric/logical "Critical Alert" or
// "Business Logic" rule stated in the department's own blueprint file (not
// invented) ? see Enterprise_Blueprint_2026/domains/internal_medicine/*.md.
//
// GAP NOTE: no dedicated DB tables exist yet for these departments (genuine
// classification C). This engine implements ONLY the decision logic; persistence
// needs schema design + user sign-off, same as Wave 10.
// =====

```

FILE: lis.js
=====

```

```

// =====
// lis.js ? E3 Laboratory / LIS clinical-safety core (PURE functions, no I/O, no DB).
// =====
// CLINICAL SAFETY ? FAIL-SAFE / FAIL-CLOSED by construction:
// * autoVerify() returns 'verified' ONLY when ALL of these hold:
// - a numeric result value is present and finite, AND
// - a valid numeric reference range (ref_low/ref_high) is present, AND
// - the value is WITHIN [ref_low, ref_high] (inclusive), AND
// - the value is NOT a critical value, AND
// - there is NO significant delta vs a valid prior result.
// ANY uncertainty (missing value, missing/invalid range, missing prior when a
// prior is required by policy is NOT required here ? absence of prior is allowed
// for first-ever results, but a malformed prior forces HOLD) => 'held' for manual review.
// * isCritical() flags life-threatening values from a per-analyte critical table; on
// any ambiguity (non-numeric, unknown analyte) it returns false for the flag but
// autoVerify still HOLDS because criticality cannot be ruled out only via range.
// * NEVER silently auto-verifies. When in doubt: HOLD.
//
// These functions are deliberately dependency-free so they can be unit-tested with
// `node lis_autoverify_test.js` (no DB, no network) and reused server-side.
// =====

// =====
// Gate 8 ? NPHIES KSA-conformant FHIR *message* bundles.
//
// The builders above emit minimal FHIR R4 `collection` bundles that are NOT
// NPHIES-conformant. NPHIES uses FHIR messaging: a `message` Bundle whose first
// entry is a MessageHeader (with a KSA event code), every entry addressed by a
// urn:uuid fullUrl with references resolved to those fullUrls, meta.profile on
// each resource, and KSA/ICD-10-AM/SBS terminology systems.
//
// These builders produce that structure. NOTE: the exact profile version pins and
// the full set of KSA extensions/value-sets must be reconciled against the LIVE
// NPHIES Implementation Guide before production submission ? this is the structural
// scaffold, deterministic and unit-testable, not a certified end-to-end conformance.
// =====

=====
FILE: nursing_scores.js
=====

```

```

/**
 * nursing_scores.js ? E6 NURSING SCORES (pure, server-side, unit-testable).
 * No DB / no HTTP / no I/O. These are deterministic clinical-scoring functions used by the
 * POST /api/nursing/scores route AND by nursing_scores_unit_test.js. Keeping them pure means the
 * server computes scores authoritatively (the client cannot forge a "score" ? it sends raw
 * observations and the server derives + bands the result).
 *
 * Implemented:
 * - computeMorseFallRisk(...) ? Morse Fall Scale (0?125), bands Low/Moderate/High.
 * - computeBraden(...) ? Braden pressure-ulcer scale (6?23), bands by risk.
 * - computeNEWS(...) ? NEWS2 (National Early Warning Score 2) from vitals.

```

```

* - computePainBand(score) ? 0?10 numeric pain ? band.
*
* IMPORTANT-1 ? NEWS vs NEWS2: this engine implements NEWS2 (RCP 2017). We use the NEWS2
* thresholds (SpO2 Scale 1: 96+ =0, 94?95 =1, 92?93 =2, <=91 =3) and add +2 for supplemental
* oxygen, plus +3 for any non-'A' (V/P/U or new confusion) consciousness level. LIMITATION: we
* model SpO2 *Scale 1* only. We do NOT implement the NEWS2 *Scale 2* SpO2 ranges used for
* patients with target-range 88?92% (hypercapnic respiratory failure / chronic T2RF). For those
* patients the on_oxygen +2 and the Scale-1 SpO2 points will OVER-score; a Scale-2 toggle is a
* documented follow-up. Aggregate banding (Low/Medium/High) and the single-parameter-3 escalation
* to at-least-Medium follow NEWS2.
*
* IMPORTANT-2 / FIX item 8 ? computeBraden fail-CLOSED on incomplete input: if any of the 6
* subscales is missing/null/NaN we return { score: null, band: 'Incomplete', error: '...' } rather
* than silently defaulting to the safest (highest) subscale value. The /api/nursing/scores route
* rejects an Incomplete Braden with 422 (a partial pressure-ulcer score must never be stored as
* authoritative ? under-scoring risk is a patient-safety hazard).
*
* ???????? ????????? (???? ?? ??? ?????? ? ?? ??? ??? "score" ?? ??????).
*/

// =====
// onboarding.js ? E0 Facility Onboarding Wizard (server side)
// Self-contained module: archetype -> enabled module-index mapping, input validation,
// and a mountable POST /api/admin/facilities/provision route.
//
// Security posture (must NOT be weakened):
// - Route guarded by requireAuth + requireRole('settings') + INLINE super-admin guard
// (role !== 'Admin' -> 403 + audit BLOCKED_), mirroring the deployed Gate-4 / user-create pattern.
// - Single DB transaction on a raw pooled client (BEGIN/COMMIT/ROLLBACK). After the tenant row is
// created, app.tenant_id is set (transaction-local) so RLS-protected INSERTs (facilities,
// facility_modules) pass WITH CHECK for the NEW tenant.
// - NO default passwords: a strong random password is generated if none is supplied; the plaintext
// is returned ONCE in the 201 body for out-of-band delivery and is NEVER logged.
// - Integrations are GATED: only name + enabled flag + non-secret config are recorded. No API keys,
// secrets, certificates, OTP, CSR, or outbound calls during provisioning.
// - audit_trail written via logAudit('FACILITY_PROVISIONED').

```

```

/**
 * orders.js ? E-X1 unified orders thin server module (additive).
 *
 * mountOrderRoutes(app, { pool, requireAuth, requireTenantScope, getRequestTenantContext, logAudit, requirePer
mission })
 *
 * Exposes:
 * POST /api/orders ? create one order header + its line items in ONE transaction, tenant-scoped, aud
ited.
 * GET /api/orders ? list orders for the tenant; optional ?encounter_id= and ?patient_id= filters.
 *
 * Routing-by-type is intentionally a STUB: it records type ? {lab,rad,med,consult} on the order row and
 * leaves the per-department dispatch (lab_radiology_orders / prescriptions+pharmacy_prescriptions_queue)
 * to the existing handlers ? this module does NOT implement lab/rad/pharmacy internals.
 *
 * Tenant isolation: orders/order_items/order_sets are under FORCE RLS. The transaction uses a dedicated
 * client from pool.connect(); the db_postgres pool.query wrapper that auto-binds app.tenant_id does NOT
 * apply to a raw client, so we set_config('app.tenant_id', ...) on the client ourselves (and reset it in
 * finally), exactly mirroring db_postgres.js. tenant_id/facility_id are stamped from the trusted session.

```

```

*
* Mounted AFTER all existing routes and BEFORE the SPA catch-all (server.js wiring).
