FILE: docs\migrations\blood_bank\01_blood_bank_e13_up.sql
=====

-- =====
-- E13 BLOOD BANK ? candidate migration (UP) [PLAN ONLY ? do not auto-execute]
-- =====
-- Brings the four pre-existing blood_bank_* tables under tenant isolation
-- (tenant_id NOT NULL REFERENCES tenants(id) + FORCE RLS + canonical policy),
-- adds audit/state columns, and creates the NEW blood_bank_transfusion_reactions
-- table for reaction reporting + recall/lookback.
--
-- Idempotent: re-runnable. Adds columns via ADD COLUMN IF NOT EXISTS; policies
-- via DROP POLICY IF EXISTS then CREATE. NOT NULL on tenant_id is applied only
-- after backfill, and guarded so a second run does not fail.
--
-- NOTE: this migration ALTERS pre-existing tables (units/donors/crossmatch/
-- transfusions) ? it never DROPS them. The DOWN reverses ONLY these additions
-- and drops ONLY the genuinely new reactions table.

* e4_03_rad_reports_up_validate_down.js
* =====
* E4 ? STRUCTURED RADIOLOGY REPORTING + CRITICAL + PRIOR COMPARE
* (candidate migration; NOT auto-run; gated; idempotent)
*
* Adds `rad_reports`: a structured radiology report with templated findings
* (e.g. BI-RADS) stored as `structured_json`, an `impression`, a critical-finding
* flag, signing fields, and an addendum chain (`addendum_of`).
*
* CRITICAL-RESULT FAIL-CLOSED RULE (enforced in the server, schema-supported here):
* A report flagged `is_critical = TRUE` CANNOT be signed (`signed_at`/`signed_by`)
* until a critical notification has been documented ? tracked by
* `critical_notified_at` (and a `notifications` row of type 'critical' + audit).
* The server refuses the sign transition when is_critical AND NOT critical_notified.
*
* PRIOR-COMPARE RULE: the prior-study list returns only SIGNED reports for the same
* patient + modality within the tenant (the E3 Issue-1 lesson: signed priors only).
*
* Posture: tenant_id NOT NULL + FORCE RLS canonical policy + (tenant_id, ...) index.

```

```
=====
```

```
-- e50_clinical_qls_candidate_up.sql ? CANDIDATE, NOT RUN (requires owner DDL approval).
-- Gate 5 (Wave 2 isolation): close the remaining e21 clinical-metadata isolation gaps.
--
-- Findings (from Gate 0 + Gate 5 code read):
-- 1. patient_clinical_records HOLDS PHI (recorded_values JSONB) but has NO RLS and no FK
--    to tenants ? app-layer WHERE tenant_id=$ is the only guard (no DB backstop).
-- 2. clinical_templates has NO tenant_id and NO RLS (isolation only transitive via the
--    RLS-protected clinical_departments; direct dept_id reads were unguarded until the
--    Gate 5 code fix added a JOIN).
-- 3. clinical_knowledge_vectors (RAG chunks) has NO tenant_id and NO RLS.
-- 4. clinical_departments.code is GLOBALLY UNIQUE, so `ON CONFLICT (code)` (server.js
--    POST /api/clinical/departments) collides across tenants ? two tenants cannot both
--    own 'CARDIOLOGY'. Correct constraint is UNIQUE (tenant_id, code).
--
-- This migration is idempotent and additive. It BACKFILLS tenant_id where the column is
-- newly added: clinical_templates/knowledge_vectors inherit tenant_id from their parent
-- department (which is already tenant-scoped). Rows whose parent tenant is unresolved are
-- left NULL and the NOT NULL / FK steps are guarded so the migration fails loudly rather
-- than silently mis-assigning PHI/metadata to tenant 1.
--
-- ORDER OF OPERATIONS matters: run this DDL FIRST, THEN flip server.js

=====

```

E4 ? Radiology (RIS + PACS metadata) candidate migrations

These migrations are ****candidates**** for the E4 epic. They are ****NOT**** executed automatically and must NOT be run against production without an explicit owner gate + backup.

Every migration file exports `{ up, validate, down }` and runs against a `pg` client/pool passed in by the caller. They are ****idempotent**** (safe to re-run) and follow the canonical RLS posture already enforced on the 150 FORCE-RLS tables in this codebase:

- new tenant-scoped tables carry `tenant\_id INTEGER NOT NULL`
- `ALTER TABLE ... ENABLE ROW LEVEL SECURITY; ... FORCE ROW LEVEL SECURITY;`
- a single canonical FOR ALL policy:

```

`USING (tenant_id = NULLIF(current_setting('app.tenant_id', true), ' '::integer))
`WITH CHECK (...)` ? identical predicate (matches `rls_local_dry_run_3_tables.js`)

```
- a `(tenant\_id, ...)` composite index

`down` drops the policy, disables RLS, drops the table's own indexes, then the table.

Files

| Order | File | Adds |
|-------|---|--|
| 1 | `e4_01_rad_worklist_up_validate_down.js` | `rad_exams` (RIS worklist state machine) |
| 2 | `e4_02_dicom_studies_up_validate_down.js` | `dicom_studies` (DICOM study METADATA only ? no bytes) |
| 3 | `e4_03_rad_reports_up_validate_down.js` | `rad_reports` (structured report + critical + signing) |

Manual run convention (LOCAL ONLY, gated)

```

...
NODE_ENV=development node -e "const {Pool}=require('pg');const p=new Pool();(async()=>{ \

```

```
const m=require('./migrations/e4_01_rad_worklist_up_validate_down.js'); \
await m.up(p); console.log(await m.validate(p)); await p.end(); }())"
...
```

`up` runtime needs `app.tenant\_id` set per-session by the app's monkey-patched `pool.query` (see `db\_postgres.js`); when running raw migrations as a superuser this is irrelevant for DDL.

DEPLOY STEPS ? NOT DEPLOYED

See the final report / commit message. Nothing here has been executed or pushed.

```
